Amazon Product Reviews Sentiment Analysis using NLP

Authors:

- Wambui Githinji
- Lynette Mwiti

- Felix Njoroge
- Wilfred Lekishorumongi
- Monica Mwangi
- Joan Maina

Problem Statement

Reviews are critical to businesses as they offer insights into customer satisfaction, preferences and areas of improvement.

Businesses need to understand and interpret these reviews in order to cut through the competition. Lots of reviews are generated daily and manually analyzing them is impractical.

Objectives

Use Sentiment analysis to help the businesses get actionable insights from the feedback received from customers.

The approach taken with the analysis seeks to

- Determine the sentiment of the reviews (positive or negative) to understand overall customer satisfaction and feedback.
- Utilize sentiment analysis to help our stakeholders understand customer preferences across various products.
- Conduct exploratory data analysis to understand the distribution of sentiments over time, across barands and products.
- Leverage customer reviews to identify areas for improvement in products based on user experience.
- Build a classifier model to help predict reviews as positive or negative

Data Sources

Data for this project was obtained from Kaggle [repository] (https://www.kaggle.com/datasets/datafiniti/consumer-reviews-of-amazon-products?resource=download)

The data represents:

- **Brand**: The brand name of the product being reviewed.
- **Categories:** Categories or tags that classify the product (e.g., electronics, home, books).
- **Keys**: Keywords or identifiers associated with the product.
- **Manufacturer:** The company or entity that manufactures the product.
- **Reviews.date**: The date when the review was posted.
- **Reviews.dateAdded:** Additional date-related information, possibly indicating when the review was added to the dataset.
- **Reviews.dateSeen:** Dates indicating when the review was observed or recorded (possibly by a data aggregator or platform).
- **Reviews.didPurchase:** Boolean (true/false) indicating whether the reviewer claims to have purchased the product.
- **Reviews.doRecommend:** Boolean (true/false) indicating whether the reviewer recommends the product.
- **Reviews.id:** Unique identifier for each review.
- **Reviews.numHelpful:** Number of users who found the review helpful.
- **Reviews.rating:** Rating given by the reviewer (typically on a scale such as 1 to 5 stars).
- **Reviews.sourceURLs:** URLs pointing to the source of the review.
- **Reviews.text:** The main body of the review text.
- **Reviews.title:** The title or headline of the review.
- **Reviews.userCity:** City location of the reviewer.
- **Reviews.userProvince:** Province or state location of the reviewer.
- **Reviews.username:** Username or identifier of the reviewer.

These are the variables this analysis will focus on to derive insights.

Methodology

The process can be divided into these many parts.

Data preparation

- **Text Cleaning:** Remove or handle punctuation, special characters, numbers, and stopwords
- **Tokenization:** Split text into words or subwords.
- **Text Normalization:** Convert text to lowercase, perform stemming or lemmatization.
- **Padding/Truncation: bold text** Ensure all text sequences are of the same length.
- **Train-Test Split:** Divide your data into training, validation, and test sets

EDA

Visualisations and insights. For each characteristic we will be:

- Creating visualisations
- Drawing conclusions
- Providing recommendations

Feature Engineering

In the feature engineering section, we process and transform the textual data for further analysis and modeling.

The methods used are;

- Sentiment Analysis
- Visualization with Word Clouds
- Text Vectorization to convert textual data into numerical form using TF-IDF and Count Vectorization.
- Word Embedding using Word2Vec and FastTex
- Extraction of bigrams and trigrams

Model selection and building

The models used include a simple RNN and LSTM model

Hyperparameter tuning

Optimize hyperparameters for better performance

Model evaluation

Evaluate performance using the accuracy score

Analyze results

Look at the AUC/ROC curves and other evaluation tools

Data preparation

Importing Libraries

```
#Basic libraries
import pandas as pd

Columns with 0 Non-Null Count

- This column has 0 non-null entries, meaning all 34,660 entries are missing or null.
- This column does not contain any useful data.

Columns with 1 Non-Null Count

- This column has only 1 non-null entry, meaning out of 34,660 rows, only one entry has a value and the rest are null.
- This column contains almost no useful data.

Unique Values in 'review_text' (Total: 34660):
['This product so far has not disappointed. My children love to use it and I like the ability to monitor control what content they see with ease.'
 'great for beginner or experienced person. Bought as a gift and she loves it'
 'Inexpensive tablet for him to use and learn on, step up from the NABI. He was thrilled with it, learn how to Skype on it already...'
 ...
 "Love my Kindle Fire but I am really disappointed in the Kindle Power Fast Charging Unit. I've had it two months and I've used it many times - The first two times it worked okay but failerd on the third and many subsequent tries. I've disposed of it and use my wife's iPad Nano charger which always works just fine."
 "I was surprised to find it did not come with any type of charging cords so I had to purchase one and then found my Sprint HTC 3D charger is faster. I would not purchase again- 1st item I've ever not liked I've purchased from Amazon"
 "to spite the fact that i have nothing but good things to say about amazon and anthing i've ever gotten from them. and that i love my fire. i find it greedy that the wall charger doesn't come with the kindle. not everyone, ok most people, but still not everyone has a usb port to plug into. i'm taking my charger back. i think amazon should make things right and let anyone who purchased a kindle without a charger have one for free, or credit those who had to buy one."]

```

- The 'id' column has duplicated rows, but we will not remove them as they reflect valid multiple reviews or transactions for the same product.
- We did not set 'asins' or 'id' as indices because multiple entries for the same product (same 'asins') with different or the same 'id' are common in e-commerce datasets, reflecting multiple reviews or transactions for the same product.

Checking for placeholders

```
# Define a comprehensive list of potential placeholder values
common_placeholders = ["", "na", "n/a", "nan",  "none", "null", "-",
"--", "?", "??", "unknown", "missing", "void", "empty","#","#####"]

# Loop through each column and check for potential placeholders
found_placeholder = False
for column in raw.columns:
    unique_values = raw[column].unique()
    for value in unique_values:
        if pd.isna(value) or (isinstance(value, str) and
value.strip().lower() in common_placeholders):
            count = (raw[column] == value).sum()
            print(f"Column '{column}': Found {count} occurrences of
potential placeholder '{value}'")
            found_placeholder = True
```

```
if not found_placeholder:
    print("No potential placeholders found in the DataFrame.")
```

```
Column 'review_title': Found 1 occurrences of potential placeholder
'Na'
Column 'review_username': Found 2 occurrences of potential placeholder
'none'
Column 'review_username': Found 3 occurrences of potential placeholder
'Unknown'
```

```
# Checking our column names
raw.columns
```

```
Index(['id', 'asins', 'brand', 'product_categories', 'product_keys',
       'manufacturer_name', 'review_date', 'review_do_recommend',
       'review_num_helpful', 'review_rating', 'review_text',
'review_title',
       'review_username'],
      dtype='object')
```

```
#Checking the null values and data types after changes made
raw.info()
```

```
<class 'pandas.core.frame.DataFrame'>
Index: 34054 entries, 0 to 34624

memory usage: 3.6+ MB
```

After cleaning the data set, we now have 34,054 rows and no missing values.

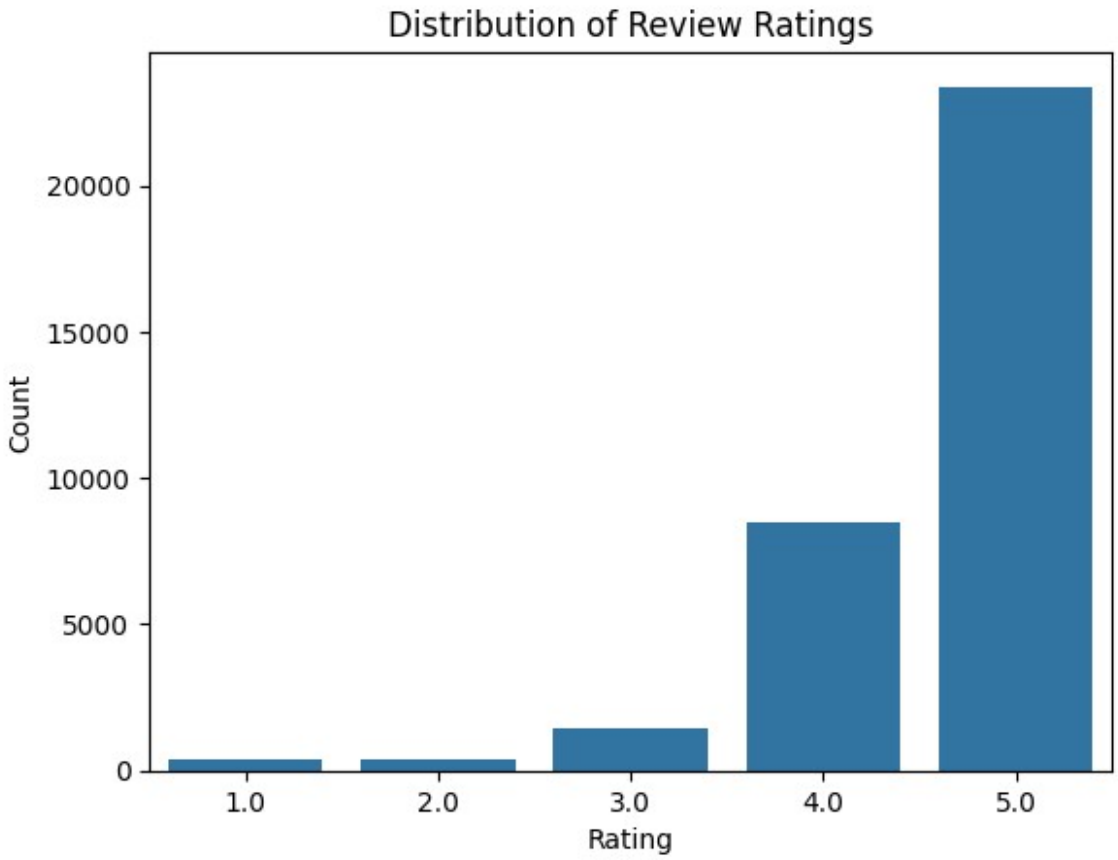
The data set is ready for EDA.

EXPLORATORY DATA ANALYSIS

UNIVARIATE ANALYSIS

1. Distribution of ratings Word frequency, Word cloud and Sentiment Distribution

```
# Distribution of ratings
import matplotlib.pyplot as plt
# Sentiment distribution (simple visualization based on ratings)
sns.countplot(x='review_rating', data=raw)
plt.title('Distribution of Review Ratings')
plt.xlabel('Rating')
plt.ylabel('Count')
plt.show()
```

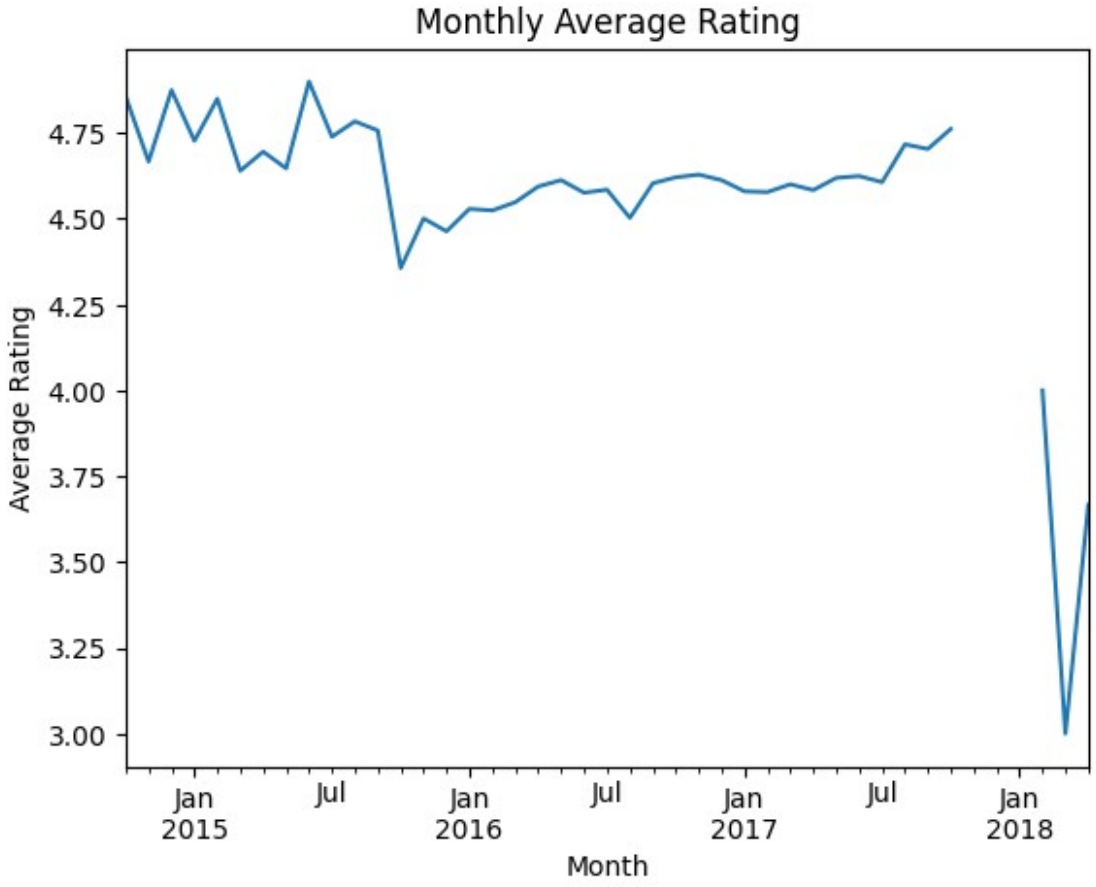


- The distribution of review ratings shows that most reviews tend to be positive, with higher counts towards ratings 4 and 5.

2.Temporal Analysis

```
# Temporal Analysis of rating over time
```

```
raw['review_date'] = pd.to_datetime(raw['review_date'])
raw.set_index('review_date', inplace=True)
raw['review_rating'].resample('M').mean().plot()
plt.title('Monthly Average Rating')
plt.xlabel('Month')
plt.ylabel('Average Rating')
plt.show()
```



- There is a slight fluctuation in average ratings over time, but no clear trend is evident from the monthly average ratings plot.

3. Reviews by product category

```
# Count occurrences of each category
category_counts = raw['product_categories'].value_counts().head(20)

# Extract top 20 categories and their counts
top_categories = category_counts.index

print("Top 20 Product Categories:")
print(category_counts)
```

```python
# Assuming categories are separated by commas and need to be split
# Convert the 'product_categories' column to string type
raw['product_categories'] = raw['product_categories'].astype(str)

# Split the categories by commas
raw['product_categories'] = raw['product_categories'].str.split(',')

# Explode the list of categories
exploded_raw = raw.explode('product_categories')

# Group by 'product_categories' and calculate the mean review rating
mean_ratings = exploded_raw.groupby('product_categories')
['review_rating'].mean().sort_values(ascending=False)

mean_ratings
```

Conclusions

- Fire Tablets, Tablets, Computers & Tablets: Dominates with 10,965 reviews, indicating a strong presence in consumer feedback.
- Stereos, Remote Controls, Amazon Echo: Follows with 6,606 reviews, highlighting significant interest in home electronics and smart devices.
- Back To College, College Electronics: Shows strong engagement in electronics geared towards college students, with 5,051 reviews.

big fan of e-readers. I prefer the e-ink screens over tablet screen
when reading books. I decided to pick up the new Kindle Voyage. Here
are my thoughts.First, the Kindle is much sleeker and lighter than the
Paperwhite model. It's very easy to hold for a long length of time
without getting tired.Secondly, the addition of the page turn buttons
is a welcomed addition. The buttons make it so easy to hold the Kindle
with one hand and turn pages.Lastly the screen. I marked off a star
because I had to return my first Voyage directly to Amazon because the
top half of the screen had a yellow tint to it that was very
distracting while reading. The replacement Kindle Voyage that I
received had a perfect screen and the 300 ppi looks amazing. That
being said, Amazon needs to really focus on quality control because
```

```
I've read that the yellow tint on the screen is a common issue. If you're spending $200 for an e-reader, then the screen should be perfect. Especially since this is the 3rd generation of the lighted screens for the e-readers.If you're an avid reader, then the Kindle Voyage would be a worthy upgrade to make. If you're a casual reader who has a Paperwhite, you're probably okay with what you have.\"\n ],\n        \"semantic_type\": \"\",\n        \"description\": \"\"\n }\n    },\n    {\n      \"column\": \"review_title\",\n \"properties\": {\n        \"dtype\": \"string\",\n \"num_unique_values\": 9,\n        \"samples\": [\n \"Almost...\"\n        ],\n        \"semantic_type\": \"\",\n \"description\": \"\"\n      }\n    },\n    {\n      \"column\": \"review_username\",\n      \"properties\": {\n        \"dtype\": \"string\",\n        \"num_unique_values\": 10,\n        \"samples\": [\n          \"Cooper25\"\n        ],\n        \"semantic_type\": \"\",\n        \"description\": \"\"\n      }\n    }\n  ]\n}","type":"dataframe"}
```

BIVARIATE ANALYSIS

1. Helpful votes vs rating

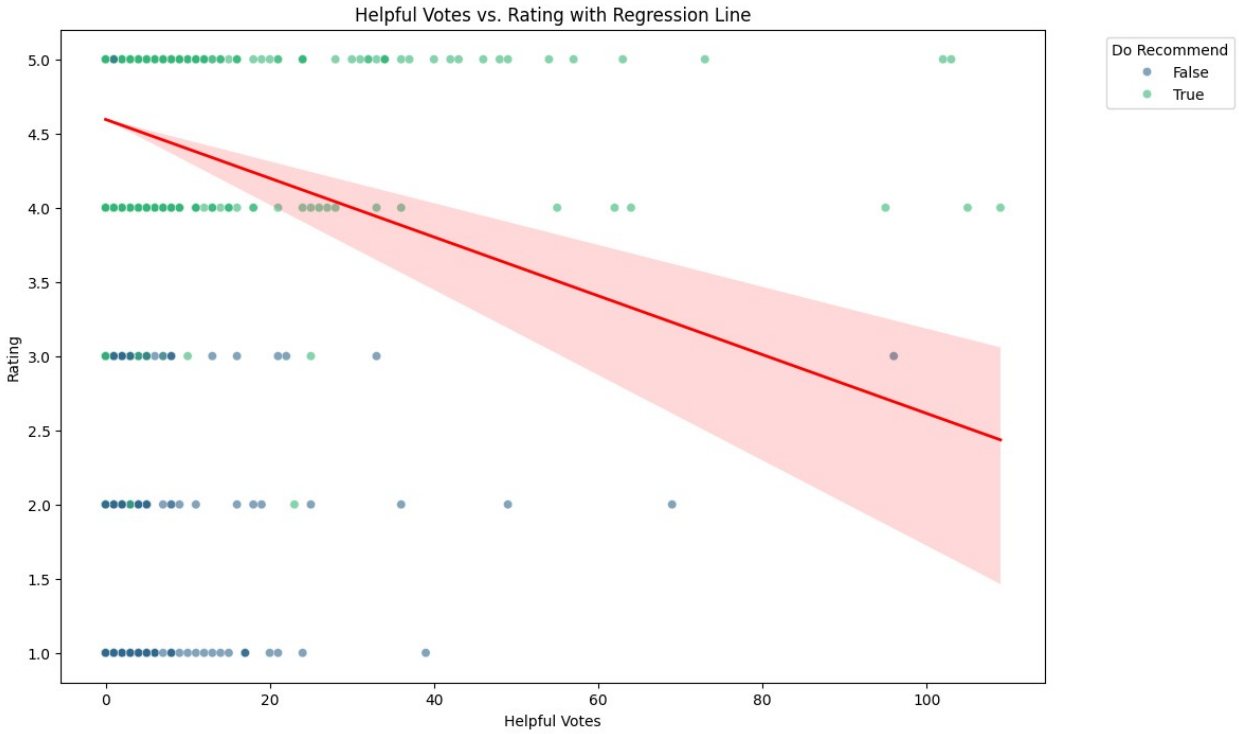
```
plt.figure(figsize=(12, 8))

# Scatter plot with color coding, size encoding, and transparency
scatter = sns.scatterplot(
    x='review_num_helpful',
    y='review_rating',
    hue='review_do_recommend',
    sizes=(20, 200),  # Minimum and maximum size of points
    alpha=0.6,
    palette='viridis',  # Using a different color palette
    data=raw
)

# Add a regression line
sns.regplot(
    x='review_num_helpful',
    y='review_rating',
    scatter=False,
    color='red',
    line_kws={"linewidth": 2},
    data=raw
)

plt.title('Helpful Votes vs. Rating with Regression Line')
plt.xlabel('Helpful Votes')
plt.ylabel('Rating')
plt.legend(title='Do Recommend', loc='upper right',
```

```
bbox_to_anchor=(1.2, 1))
plt.show()
```

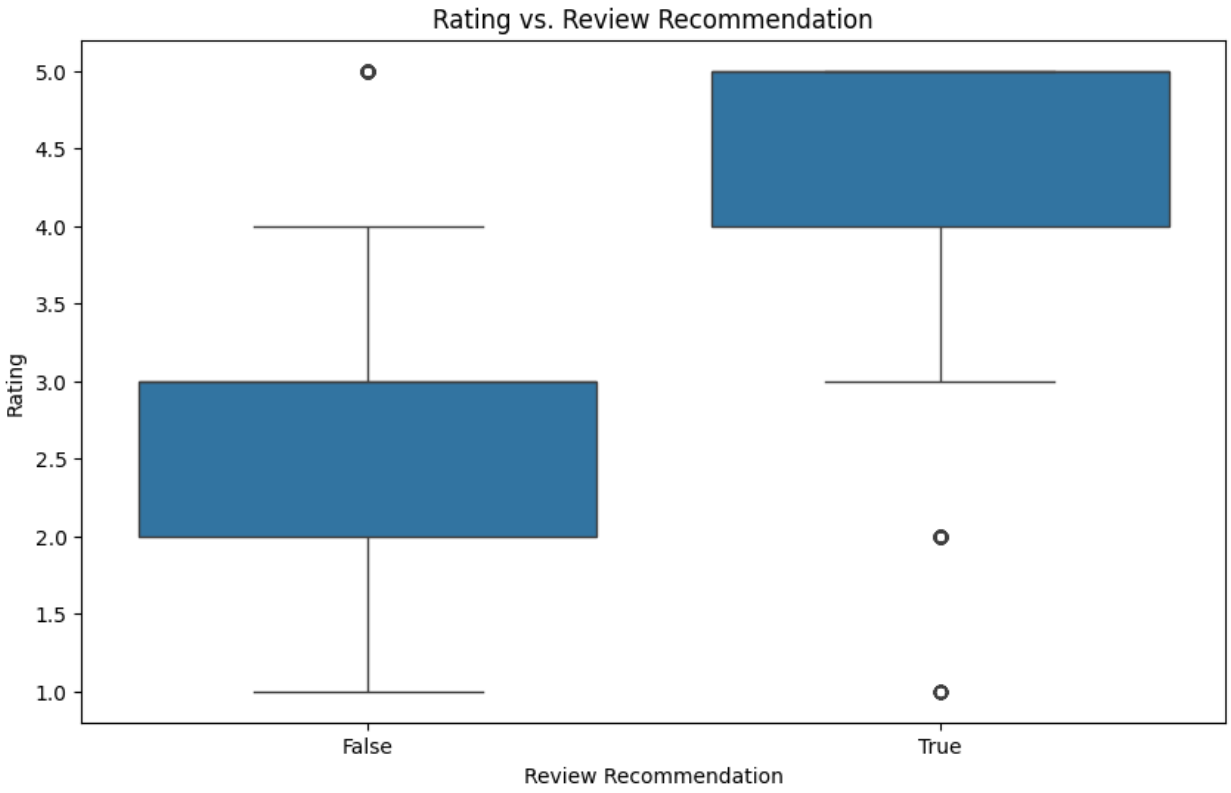


- The scatter plot and regression analysis of helpful votes versus rating illustrate a positive correlation, indicating that more helpful reviews tend to have higher ratings.
- This suggests that customers find high-rated reviews more useful

2. Rating vs. Review recommendation

```
# Convert review_do_recommend to a categorical type
raw['review_do_recommend'] =
raw['review_do_recommend'].astype('category')

# Box plot of rating vs. review recommendation
plt.figure(figsize=(10, 6))
sns.boxplot(x='review_do_recommend', y='review_rating', data=raw)
plt.title('Rating vs. Review Recommendation')
plt.xlabel('Review Recommendation')
plt.ylabel('Rating')
plt.show()
```

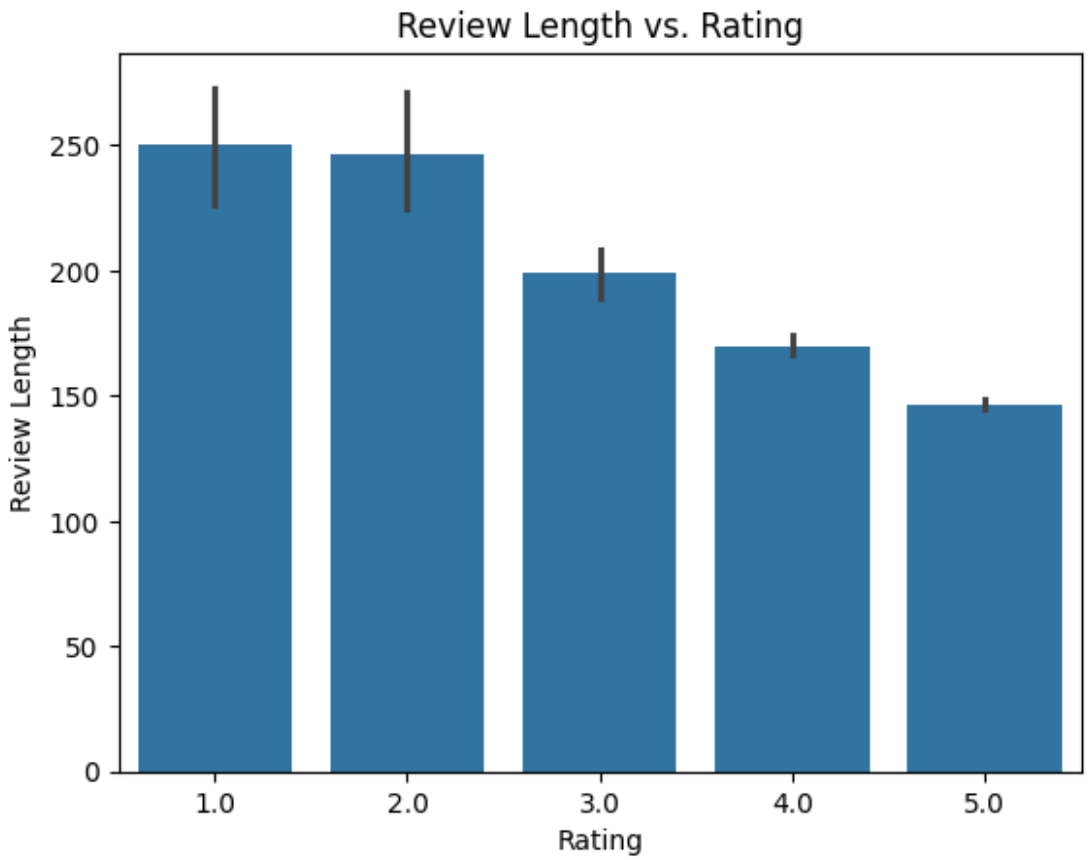


- The analysis shows that reviews with a positive recommendation (review_do_recommend = True) generally have higher ratings compared to those without a recommendation.
- This highlights the influence of product satisfaction on recommendation.

3. Rating vs Length

```
raw['review_length'] = raw['review_text'].apply(len)

sns.barplot(x='review_rating', y='review_length', data=raw)
plt.title('Review Length vs. Rating')
plt.xlabel('Rating')
plt.ylabel('Review Length')
plt.show()
```

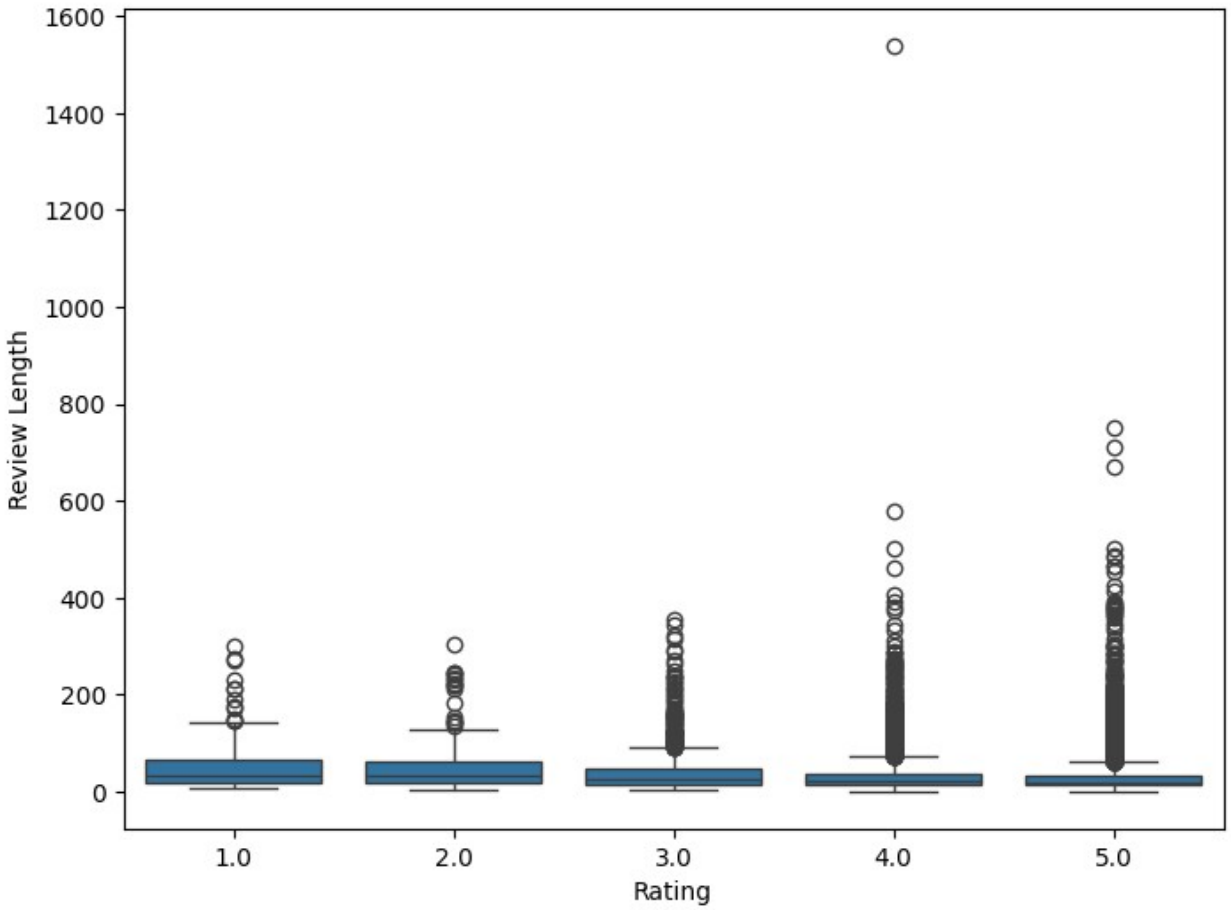


- This visualization illustrates the relationship between review length and review rating. It is evident that shorter reviews tend to receive higher ratings.

```
word_count=[]
for s1 in raw.review_text:
    word_count.append(len(str(s1).split()))
plt.figure(figsize = (8,6))

import seaborn as sns
import matplotlib.pyplot as plt
sns.boxplot(x="review_rating",y=word_count,data=raw)
plt.xlabel('Rating')
plt.ylabel('Review Length')

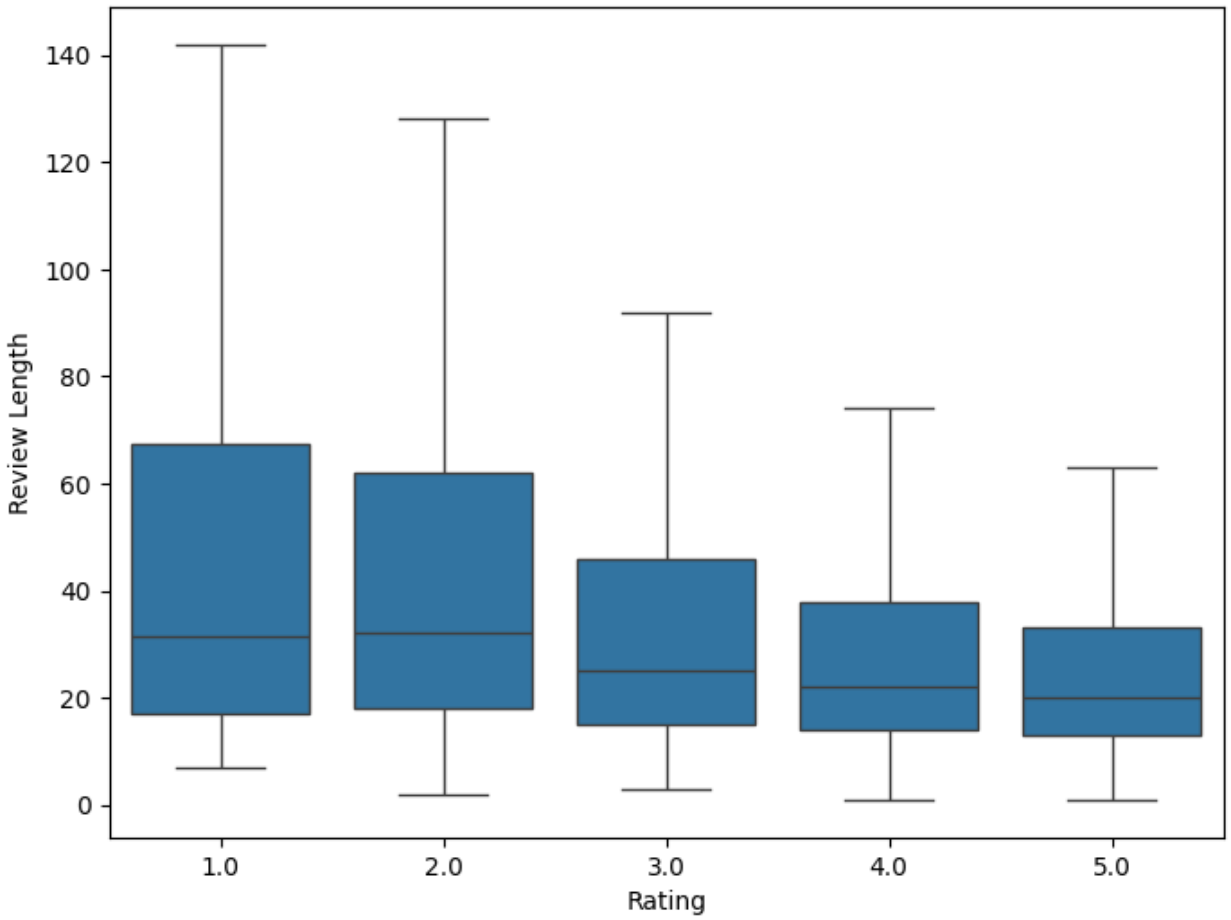
plt.show()
```



- Due to the presence of outliers shown in the box plot, our visualization is currently obscured. To improve clarity, we will proceed by removing these outliers from the dataset.

```
# Generate box plots excluding outliers

plt.figure(figsize = (8,6))
sns.boxplot(x="review_rating",y=word_count,data=raw,showfliers=False)
plt.xlabel('Rating')
plt.ylabel('Review Length')
plt.show()
```



- We can now see that shorter reviews tend to receive higher ratings much better.

Conclusions

The bar plot and box plot analyses show the relationship between review ratings and the length of reviews:

Bar Plot Analysis: Indicates that longer reviews are generally associated with lowerr ratings. This suggests that while longer reviews can provide richer insights, their association with lower ratings indicates that customers who invest more time in detailing their experiences often do so when they feel particularly disappointed or dissatisfied.

Box Plot Analysis: Initially showed outliers affecting clarity in visualization. After excluding outliers, the relationship between review length and rating became clearer

Lower ratings tend to have a wider range of review lengths, suggesting variability in experiences or dissatisfaction reasons.

Higher ratings are associated with a more concentrated range of review lengths, possibly indicating clearer satisfaction or positive experiences with the product.

These insights provide a deeper understanding of how review characteristics such as recommendation status and review length correlate with customer ratings, contributing valuable insights for product evaluation and improvement strategies.

3. Multivariate Analysis

1. Scatter plot of reviews

```
# Ensure the column names are correct
review_rating_col = 'review_rating'
review_num_helpful_col = 'review_num_helpful'
total_votes_col = 'total_votes'
review_did_purchase_col = 'review_did_purchase'

# Check if 'review_did_purchase' exists, if not create it with a
default value
if review_did_purchase_col not in raw.columns:
    raw[review_did_purchase_col] = False

# Ensure 'total_votes' column exists, if not create it with a default
value
if total_votes_col not in raw.columns:
    raw[total_votes_col] = 0

# Plotting

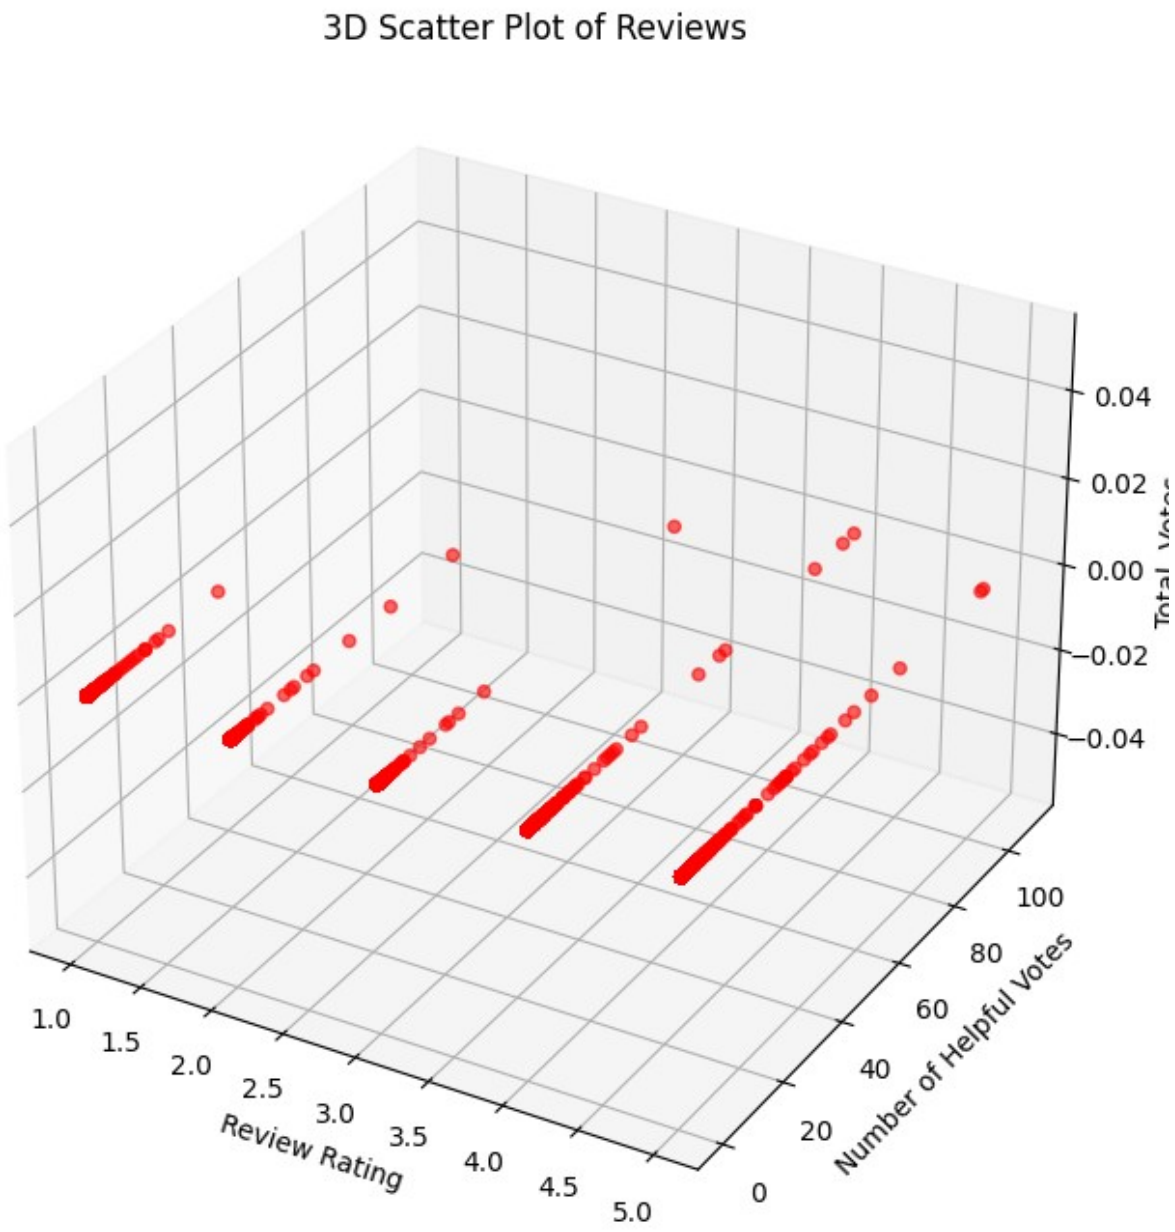
fig = plt.figure(figsize=(10, 8))
ax = fig.add_subplot(111, projection='3d')

# Map verified purchase to colors
colors = raw[review_did_purchase_col].map({True: 'blue', False:
'red'})

sc = ax.scatter(raw[review_rating_col], raw[review_num_helpful_col],
raw[total_votes_col], c=colors, alpha=0.6)

# Adding labels and title
ax.set_xlabel('Review Rating')
ax.set_ylabel('Number of Helpful Votes')
ax.set_zlabel('Total  Votes')
plt.title('3D Scatter Plot of Reviews')

plt.show()
```

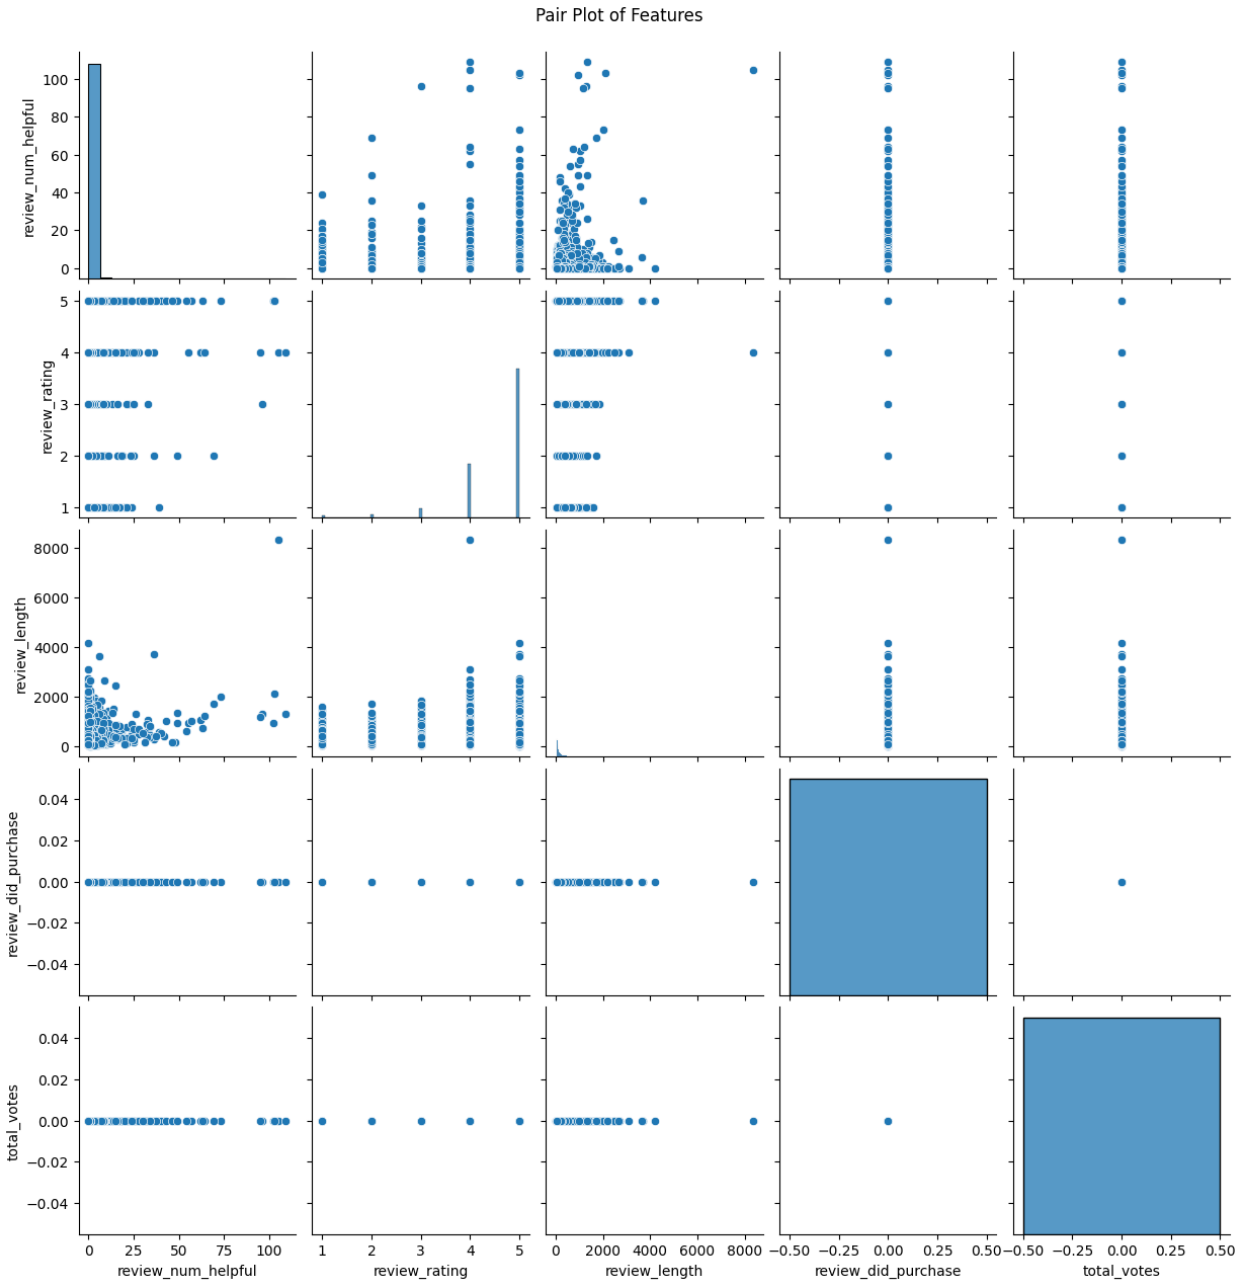


Conclusions

- Visualizing reviews based on rating, helpful votes, and total votes shows various patterns, but it doesn't clearly reveal distinct groups based on whether the purchase was verified.

2. Pair Plot of Features

```
sns.pairplot(raw)
plt.suptitle('Pair Plot of Features', y=1.02)
plt.show()
```



Conclusions

Pair Plot: The pair plot visually explored relationships between different numerical features in the dataset. It provides a quick overview of potential correlations and distributions among variables, aiding in identifying patterns or trends that might warrant further investigation.

Data pre-processing

```
# Check the column names
print(raw.columns)
```

```
Index(['id', 'asins', 'brand', 'product_categories', 'product_keys',
       'manufacturer_name', 'review_do_recommend',
'review_num_helpful',
       'review_rating', 'review_text', 'review_title',
'review_username',
       'review_length', 'review_did_purchase', 'total_votes'],
      dtype='object')
```

- Let's preview the first sentence in our text

```
# Previewing the first sentence in our text

first_document = raw.iloc[2]['review_text']
first_document

{"type":"string"}

# Changing the name of our dataframe

data = pd.DataFrame(raw)
```

- For NLP preprocessing, we'll eliminate stopwords, punctuation, and numbers, and convert text to lowercase.
- Subsequently, tokenizing our data is essential because it breaks down text into individual words or tokens, enabling deeper analysis and understanding of the textual content.

```
# Download NLTK stopwords and punctuation
nltk.download('stopwords')
nltk.download('punkt')

# Load stopwords and punctuation
stop_words = set(stopwords.words('english'))

# Function to clean and preprocess text
def clean_text(text):
    # Ensure text is a string and lowercase
    text = str(text).lower()

    # Remove numbers
    text = re.sub(r'\d+', '', text)

    # Remove punctuation
    text = text.translate(str.maketrans('', '', string.punctuation))

    # Tokenization using regex pattern
    pattern = "([a-zA-Z]+(?:'[a-z]+)?)"
    tokens = nltk.regexp_tokenize(text, pattern)

    # Remove stopwords
    clean_tokens = [token for token in tokens if token not in
```

```
stop_words]

    return ' '.join(clean_tokens)

data['clean_text'] = raw['review_text'].apply(clean_text)
data['clean_title'] = raw['review_title'].apply(clean_text)

# Display the cleaned text along with original columns
data[['review_text', 'review_title', 'clean_text', 'clean_title']]
```

```
[nltk_data] Downloading package stopwords to /root/nltk_data...
[nltk_data]   Package stopwords is already up-to-date!
[nltk_data] Downloading package punkt to /root/nltk_data...
[nltk_data]   Package punkt is already up-to-date!
```

```

Feature Engineering

In the feature engineering section, we process and transform the textual data for further analysis and modeling:

The methods used are;

- **Sentiment Analysis** to determine the sentiment of each review.
- **Visualization with Word Clouds** to visualize the most frequent words in positive and negative reviews
- **Text Vectorization** to convert textual data into numerical form using TF-IDF and Count Vectorization.
- **Word Embedding** to capture the semantic relationships between words by representing them in a continuous vector space.
- **Extraction of Bigrams and Trigrams**

Sentiment Analysis

This was done using the SentimentIntensityAnalyzer from the vaderSentiment library to calculate a sentiment score for each review.

Each review was labeled with a sentiment score, and reviews were classified as either 'positive' or 'negative' based on this score.

```
from nltk.sentiment.vader import SentimentIntensityAnalyzer

# Download the VADER lexicon
nltk.download('vader_lexicon')

# Initialize the VADER sentiment analyzer
sid = SentimentIntensityAnalyzer()
# Define the sentiment function to calculate the compound score
def sentiment(x):
    score = sid.polarity_scores(x)
    return score['compound']

# Apply the sentiment function to the text column to get sentiment
scores
data['sentiment'] = data['clean_text'].apply(lambda x: sentiment(x))

# Print the DataFrame with the sentiment scores
data[['clean_text', 'sentiment', 'review_rating']]
```

```
[nltk_data] Downloading package vader_lexicon to /root/nltk_data...
[nltk_data]   Package vader_lexicon is already up-to-date!
```

```

Labelling the reviews using the sentiment scores

- Scores ranging from 0 - 0.5 will be labeled as **negative**
- Scores ranging from 0.6 - 1 will be labeled as **positive**

```
# Filter the original data DataFrame for negative and positive reviews
negative_reviews_text = data[data['sentiment'].apply(lambda x: 0 <= x <= 0.5)]['clean_text']
positive_reviews_text = data[data['sentiment'].apply(lambda x: x > 0.5)]['clean_text']

# Create labels for negative and positive reviews
data.loc[data['sentiment'] <= 0.5, 'label'] = 'negative'
data.loc[data['sentiment'] > 0.5, 'label'] = 'positive'

# Print the updated DataFrame to verify
# Print the DataFrame with the sentiment scores
data[['clean_text', 'sentiment', 'label']]
```

Feature Extraction

- In this step, we will extract bigrams from the text data and analyze their frequency.

```
#Extraction of Bigrams

# Function to generate n-grams
from collections import defaultdict
from nltk import ngrams # Import the ngrams function

# Function to generate n-grams
def generate_ngrams(clean_text, n):
    words = clean_text.split()
    return list(ngrams(words, n))

# Initialize a defaultdict for frequency counts
freq_dict = defaultdict(int)

# Calculate bigram frequency
for sent in data["clean_text"]:
    for word in generate_ngrams(sent,2):
        freq_dict[word] += 1
# Sort the frequency dictionary and create a DataFrame
fd_sorted = pd.DataFrame(sorted(freq_dict.items(), key=lambda x: x[1],
reverse=True))
fd_sorted.columns = ["word", "wordcount"]
print(fd_sorted.head(25))
```

```
                   word  wordcount

Word Vectorization

Methods used are:

TF-IDF Vectorization

The TF-IDF (Term Frequency-Inverse Document Frequency) vectorizer transforms the text into a weighted matrix, where each term's importance is adjusted based on its frequency in the document and across all documents.

Count Vectorization

The Count Vectorizer to converts the text into a matrix of token counts, representing the raw frequency of each term.

The result

Two matrices one with TF-IDF weights and another with raw token counts, each representing the reviews in a numerical format.

```
from sklearn.feature_extraction.text import CountVectorizer

clean_text = data['clean_text']

# Initialize CountVectorizer
vectorizer = CountVectorizer()
```

```
# Fit and transform the clean_text column
X_count = vectorizer.fit_transform(clean_text)

# Print the array representation of the features
print(X_count.toarray()[1:])
```

```
[[0 0 0 ... 0 0 0]
 [0 0 0 ... 0 0 0]
 [0 0 0 ... 0 0 0]
 ...
 [0 0 0 ... 0 0 0]
 [0 0 0 ... 0 0 0]
 [0 0 0 ... 0 0 0]]
```

```
# CountVectorizer
count_vec = CountVectorizer()
# Convert the Pandas Series to a list of strings
X_count = count_vec.fit_transform(clean_text.tolist())
print('CountVectorizer:')
print(count_vec.get_feature_names_out()[:10], '\n')
```

```
CountVectorizer:
['aa' 'aaa' 'aamazon' 'aand' 'abandon' 'abandoned' 'abandoning'
'abattery'
 'abc' 'abcmouse']
```

- We extracted the first 10 feature names

Next is the TF-IDF Vectorizer

```
from sklearn.feature_extraction.text import TfidfVectorizer

#Initialize the TfidfVectorizer
vectorizer = TfidfVectorizer()

# Fit the vectorizer to the corpus and transform the corpus into a TF-
IDF matrix
X_tfidf = vectorizer.fit_transform(clean_text)

# Print the TF-IDF matrix as a dense array
print(X_tfidf.toarray(), "\n")

# Print the feature names
print("Feature names:")
print(vectorizer.get_feature_names_out())
```

```
[[0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
```

```
 ...
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]]

Feature names:
['aa' 'aaa' 'aamazon' ... 'zoomed' 'zooming' 'zwave']
```

Word Embedding Techniques (Word2Vec and FastText):

We used advanced word embedding techniques to capture the semantic meaning of words in the reviews.

Word2Vec: This technique uses a neural network model to learn vector representations of words based on their context in the corpus. We trained a Word2Vec model on our tokenized text data to obtain word vectors.

FastText: Similar to Word2Vec, but it also considers subword information, making it better at handling rare and out-of-vocabulary words. We trained a FastText model to generate word vectors that include subword information.

```
from gensim.models import Word2Vec
from nltk.tokenize import word_tokenize

# Tokenize the text
sentences = [word_tokenize(doc.lower()) for doc in data['clean_text']]

# Train Word2Vec model
model = Word2Vec(sentences, vector_size=100, window=5, min_count=1,
workers=4)

# Get word vectors
word_vectors = model.wv

# Get the combined matrix of word vectors
wordvec_matrix = word_vectors.vectors
print(wordvec_matrix)
```

```

```

- Both Word2Vec and FastText are models used to create word embeddings from text data. Word2Vec focuses on capturing word meanings based on their context in sentences, while FastText adds the ability to understand word structure by considering subword information like prefixes and suffixes.

##Train test split

1. Count vectorizer

```
from sklearn.model_selection import train_test_split

# Separate features and target for each matrix
X = X_count
y = data['labeled']

# Split data into train and test sets
X_train_countvec, X_test_countvec, y_train_countvec, y_test_countvec =
```

```
train_test_split(X, y, test_size=0.2, random_state=42)

# Print the shapes of the training and test sets
print("X_train_countvec shape:", X_train_countvec.shape)
print("y_train_countvec shape:", y_train_countvec.shape)
